
Appendix 4-A

National Weather Service Climate Records

National Weather Service Climate Records

Weather data was collected from 77 weather stations in and surrounding the COHYST active boundary. The entire breadth of weather data was acquired at each weather station; from the inception of the station through the end of 2013. Weather station were chosen based upon the length, the completeness, and level of data quality of their historical data set. Each weather station needed to collect daily minimum and maximum temperature as well as precipitation. This data was applied to the CROPSIM soil water balance model for a variety of crops and irrigation methods to create inputs for the watershed model. Further detail on the use of the climate data is available in Section 5.

For four stations, Kingsley, North Platte, Gothenburg and Grand Island, precipitation and evaporation data for the period 1984 thru 2010 were used in the reservoir and canal water budget calculations that are part of the Surface Water Operations Model presented in Section 6. An exception is that evaporation data for Gothenburg were obtained by interpolation of the other records.

Table 1. NWS weather station used in the COHYST model.
